Description: This project is to create a comprehensive real-time platform for retail investors and financial analysts alike. They need a data-centric environment to study market movements in real time. The platform should allow users to monitor live stock market data, add stocks to their personalized watchlists and view technical charts as interactive graphs without the need to purchase expensive institutional software to accomplish similar tasks.

To make a production quality web application that can scale, it will be written entirely in TypeScript and use a host of modern technologies.

- Next.js for a highly responsive framework.
- Tailwind CSS and Shadcn for UI design.
- MongoDB for flexible data handling
- BetterAuth to ensure highly secure user authentication.

AI Tools & Workflow Automation: We will also integrate a variety of tools to improve our own workflow and in turn enhance the end user experience of our web application.

- Google Gemini API (AI-Powered Market Insights & Sentiment Analysis):
- Code Rabbit (AI-Powered Code Reviews):

This combination of real-time financial data, a solid Next.js stack and AI-powered workflow automation is the perfect base for a highly scalable business model.
